Deploying a Zoho Creator Application from Development to Production Environment

AIM

To deploy a Zoho Creator application from the development environment to the production environment so that the tested application can be used by its intended users reliably and securely.

PROCEDURE

1. **Prepare the development application** — Complete the forms, reports, pages, workflows, and required integrations. Remove test data and confirm that the application structure is ready for review.
2. **Test the application** — Test each form, report, workflow, validation rule, and user action. Check error handling and confirm that the application behaves as expected.
3. **Review access and security** — Check user roles, permissions, sharing settings, and access to sensitive data. Make sure each user can access only the features and records required for their work.
4. **Prepare environment settings** — Identify settings that may differ between development and production, such as connections, API credentials, email settings, and integration endpoints. Use the correct production values and protect credentials.
5. **Create a deployment package or publish the application** — In Zoho Creator, use the available application deployment, publish, or environment-management options for the account and application. Select the appropriate target environment and follow the on-screen steps. Available options can vary by plan and setup.
6. **Configure the production environment** — Verify that required connections, permissions, schedules, integrations, and other environment-specific settings are configured for production. Avoid copying development-only values into production.
7. **Verify after deployment** — Open the production application and run a short acceptance test. Confirm that forms submit, reports display correct information, workflows run, and integrations work.
8. **Release and monitor** — Share the application with authorized users, provide brief usage instructions, and monitor errors or feedback. Keep a backup or rollback plan and document the deployed version.

Deploying a Zoho Creator Application from Development to Production Environment

PROCEDURE (CONTINUED)

9. **Record the deployment** — Document the deployment date, version or change summary, responsible person, and any settings changed in production.
10. **Maintain the production application** — Apply future updates through the same review and testing process. Test changes before releasing them to users.

OUTPUT

The Zoho Creator application is deployed to the production environment and made available to authorized users. The production version has been checked for core functionality, access permissions, and required integrations. Deployment details are recorded, and a process is in place to monitor the application and manage future updates.

RESULT

The application is successfully moved from development to production after testing and configuration checks, making it ready for real-world use.

Important note

Zoho Creator's exact deployment controls can differ depending on the account plan, application setup, and current interface. Follow the deployment options available in your own Zoho Creator account and verify the production configuration before releasing the app.
