EXPERIMENT NO. 14

Exploring Pro-Code Extension of a Zoho Creator Application Using Zoho Catalyst / Custom Functions

AIM

To explore how a Zoho Creator application can be extended with pro-code capabilities using custom functions or Zoho Catalyst to add business logic and integration beyond built-in low-code features.

PROCEDURE

1. Sign in to Zoho Creator and open the Patient Appointment Booking System application.

2. Identify a task needing additional logic, such as validating appointment details or preparing a confirmation.

3. Open the workflow or functions area and create a custom Deluge function named `processAppointment`.

4. Define input parameters, such as patient name and doctor name.

5. Add business logic to validate the input values and return a success or error message.

6. Save the function and test it with sample appointment data. Correct any errors found.

7. Associate the function with a suitable workflow or invoke it from the relevant application action, where supported.

8. Submit a test appointment and verify that the function produces the expected result.

9. If available, create or open a Zoho Catalyst project and implement the required logic using a supported function or service.

10. Configure authentication and permissions securely before connecting Creator to the external service. Do not place secrets directly in code.

11. Test the integration with sample data, review logs, and handle invalid inputs or unsuccessful responses.

12. Record the test results and confirm that the appointment workflow still works correctly.

EXPERIMENT NO. 14

SAMPLE CUSTOM FUNCTION LOGIC

Illustrative Deluge-style logic for checking required patient and doctor details. Adapt field names and syntax to the function editor and integration method available in your Zoho Creator account.

```
string processAppointment(string patientName, string doctorName)
{
    if(patientName == "" || doctorName == "")
    {
        return "Error: Patient and doctor details are required.";
    }
    return "Appointment details validated successfully.";
}
```

RESULT

The pro-code extension approach was explored by preparing sample custom business logic for the Patient Appointment Booking System. The function demonstrates validation of required patient and doctor details. Custom functions and, where available, Zoho Catalyst can extend a low-code application with additional processing and integration. Successful execution should be confirmed in the actual Zoho environment.

Note: Zoho Catalyst setup and deployment depend on account access and available plan features. If Catalyst is unavailable, the custom-function portion can be completed and documented separately.
